

# Bootstrap Blocks

For Wordpress Editor

[Unlock all features: get the Design Package add-on](#)

## General settings

If you've activated a Wordpress theme build with Bootstrap choose 'Yes'. Bootstrap Blocks will use the framework defined in this theme.

If you've activated a Wordpress theme which is not build with Bootstrap choose 'No'.

Next: choose if you would like the Bootstrap framework to be loaded on ALL pages or ONLY on the pages which make use of the special Bootstrap Blocks template. Using the Bootstrap framework can result in conflicts with the activated Wordpress theme. If so: choose to load Bootstrap framework only on Bootstrap Blocks template pages. In real life a lot of themes work just fine with the Bootstrap framework loaded.

Define the Bootstrap version which will be used.

Activate 'Bootstrap colors' to define your color set which can be directly used within the editor.

## Editor settings

On the right side select the Bootstrap Blocks icon to set the default values for the plugin.

Wrapping the title with Bootstrap container results in the default page title to be displayed within the Bootstrap grid.

## Page settings

Click the settings icon. Then click Page. Here you can set the desired template for the page you're building. You will notice the new 'Bootstrap page' template. When you've opted (General settings) for 'loading Bootstrap framework only on Bootstrap Blocks template pages' you'll have to choose this template. If otherwise you can ignore this setting.

Set the width of the editor fields. Stretch it up to 100% instead of the default limited Wordpress Editor width.

## Building a page

First click on the Plus icon in the editor. Or the blue one on the left side of the screen.

In the left panel scroll to the Bootstrap Blocks section. Click on Bootstrap container to insert it.

A Bootstrap container (one row, three columns) is inserted into the editor. For convenience you can give any container a name. Just click on it to edit.

Click on a column and press delete to remove it. Pressing the plus will add a column. You can also duplicate columns.

Click a column to edit it. Choose a background color for instance.

**Setting columns widths:** when you don't set your own preferences here Bootstrap Blocks will always evenly divide the columns over the containers' width.

Set the columns width (1 to 12 columns).

**Example:** when setting 'SM screen size' to 5 columns without defining the other screen sizes results in:

xs: 12 col | sm: 5 col | xs: 5 col | xs: 5 col | xs: 5 col

**Example:** when setting 'SM' to 5 and 'LG' to 4 results in:

xs: 12 col | sm: 5 col | xs: 5 col | xs: 4 col | xs: 4 col

**Example:** when setting 'XS' to 10, 'SM' to 6 and 'XL' to 4 results in:

xs: 10 col | sm: 6 col | xs: 6 col | xs: 6 col | xs: 4 col

## Building a page

Select the row. Now change the alignment for example to centered. 2 columns with each 5 columns' width will be nicely centered on the page

Ordering: results in changing the default order of the columns. Can come in very handy when creating a responsive design.

Container wrapper: results in displaying it on full width of the page window. You can also set a desired background color.

Responsive spacer: add some air to your design. This one is not based on pixels but responds on the page windows size.

You can choose to hide the responsive spacer on designated screen sizes.

## Building a page

Row based on percentages: next to the default rows with columns based on the Bootstrap grid you can also opt for a row with columns which can be divided by percentages.

Full page width header: set a wrapper on the container. Place an image in the column inside the container. Set the alignment of the row to centered.

You can add CSS-classes to containers, rows & columns.

Panel(s) indicating column width settings

Add extra rows inside containers.

## Building a page

Set editor column view: click to change the way the editor shows columns.

Lock container layout for editors: click to lock the container layout options for editors. They will be able to place another images and/or change text. But the layout stays intact.

Bootstrap button: insert a Bootstrap button based on the Bootstrap framework.

You can adjust it to your liking.
